A feasible cycle is not an ordered grade

n = 3; D = 1; original M = 3.
τ = 1/2; q = 1; t = 1/3; α = 0.

States: (3,2,1), (1,3,2), (2,1,3),
each with probability 1/3.

Free pairs

27 pairwise reports

Cycle: 1 > 2 > 3 > 1

Minimum risk	**1/3**
Issued pairs N	**3**
Strict exceedance J	**0**
P(any issued error)	**1**

Ordered grades

13 ordered partitions

All withheld

Minimum risk	**1/2**
Issued pairs N	**0**
Strict exceedance J	**0**
P(any issued error)	**0**

Cycle: one error among three directions
in every state, so F/N = 1/3.
Strict exceedance J = P(F/N > 1/3) = 0;
P(any issued error) = 1.

The cycle has no grade matrix.
With no issued directions, J = 0.
