A feasible cycle is not an ordered grade

n = 3; D = 1; original M = 3; τ = 1/2; q = 1; t = 1/3; α = 0.

States (3,2,1), (1,3,2), (2,1,3), each with probability 1/3.

	Free pairs 27 pairwise reports	**Ordered grades** 13 ordered partitions
Selected action	1 > 2 > 3 > 1	All withheld
Minimum risk	**1/3**	**1/2**
Issued pairs N	3	0
Strict exceedance J	0	0
P(any issued error)	1	0

Cycle: exactly one error among three directions in every state.

Thus F/N = 1/3, so J = P(F/N > 1/3) = 0, although any-error probability is 1.

The cycle has no grade matrix; with no issued directions, J = 0.
