Approximate feasibility can miss the intended constraint

One pair, one criterion; M = 1.
Exact forward error t+1/10; approximate t.

t = 0; q = 1/20; ε = 1/10

q − ε = -1/20; q + ε = 3/20

Report	N	$\widehat{E}$	E
Hold	0	0	0
A>B	1	0	1/10
B>A	1	1	9/10

Report	Inner	Exact	Nominal	Outer
Hold	**Yes**	**Yes**	**Yes**	**Yes**
A>B	No	No	**Yes**	**Yes**
B>A	No	No	No	No

t = 1/5; q = 1/4; ε = 1/10

q − ε = 3/20; q + ε = 7/20

Report	N	$\widehat{E}$	E
Hold	0	0	0
A>B	1	1/5	3/10
B>A	1	4/5	7/10

Report	Inner	Exact	Nominal	Outer
Hold	**Yes**	**Yes**	**Yes**	**Yes**
A>B	No	No	**Yes**	**Yes**
B>A	No	No	No	No

Inner: $\widehat{E} \le (q-\varepsilon)N$

Exact: $E \le qN$

Nominal: $\widehat{E} \le qN$

Outer: $\widehat{E} \le (q+\varepsilon)N$

At t=0, A>B has N=1. Inner $0 \le -1/20$ fails.
Clipping to zero wrongly admits it;
exact 1/10 > q=1/20 still fails.

Hold: N=0, all count rows are $0 \le 0$;
its error fraction is undefined. Exact means
the intended supplied law; tests are separate.
