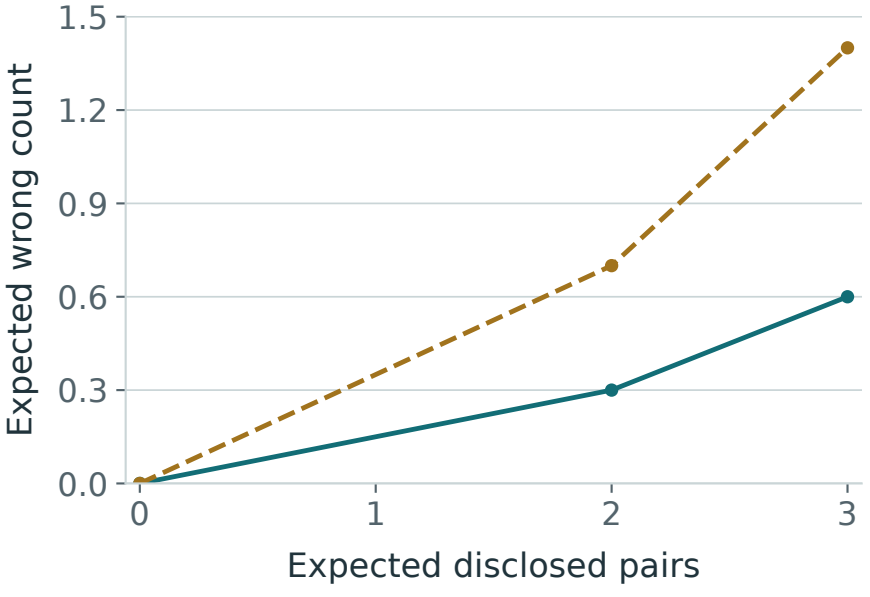
Three units, two objective contrasts

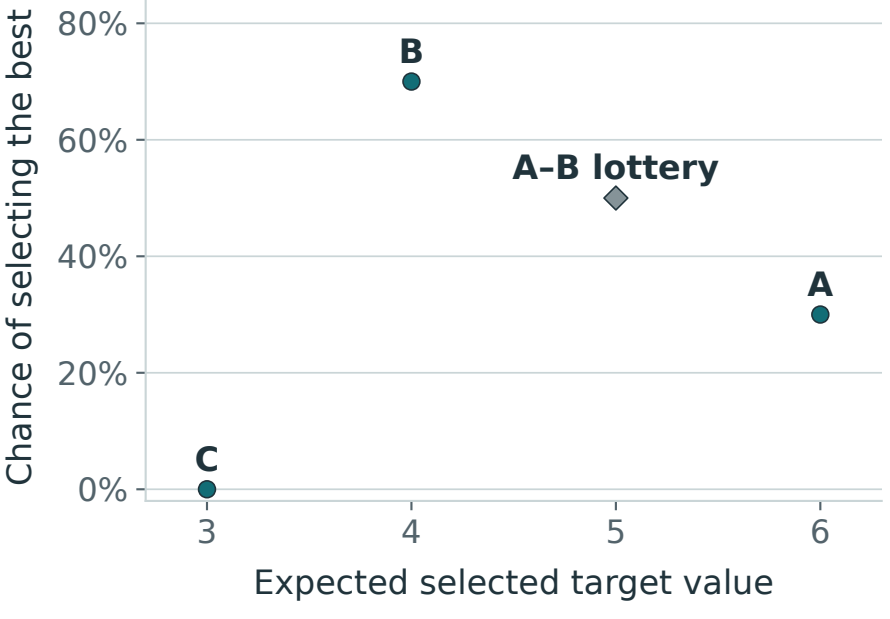
One exact synthetic law; larger targets have higher priority.

A. Coherent reports



Segments mix whole reports; N = 1 is not deterministic.

B. Select one unit



Circles select one named unit. The diamond adds a uniform A–B lottery to report 112, independently of the latent state.

A reported tie does not select a unit.
Different objectives; no causal policy effect.
No fit, simulation or solver is shown.
