A Selected proof routes

Common declaration

Target, law, loss and feasible family.
Retain original units and pair count M.

Weak-error route

Equality counts as wrong.
$R^s = [A^s + \tau(M - N)]/M$

Equality-neutral route

Strict error + distinct withholding.
$R^s_{\mathrm{TA}} = [A^s_{\mathrm{TA}} + \tau(T - Q)]/M$

Risk → comparison and count hull

Own-risk optimum: eligible competitors;
same law, loss and feasible family.
Count hull (N, A): fixed family;
whole reports.

Risk → guard and distinct-mass hull

Guard exists: full at-most G, no extras,
original pairs retained; existence only.
Distinct-mass hull (Q, A): fixed family;
whole reports.

Hull → extra half-cost conditions

Complementarity; full $\mathcal{A}_n$.
All strict unit-order children feasible.

Hull → extra half-cost conditions

Full active-profile equality classes.
All class-strict children feasible.
Not guard existence alone.

Selected prerequisites only; finite-sum risk needs no criterion independence.
Guard existence is a separate result: it does not imply the half-cost route.
