# What each evidence type supports

Discovery locates sources. Inspected primary passages support substantive attribution.

## Inspected primary passage

Supports: Documents a stated target, method or claim in the inspected edition.

Does not establish:
Suitability for this problem; a complete source-proof audit.

## Local derivation

Supports: Stated conclusion under the declared assumptions and supplied argument.

Does not establish:
Transfer to another law, objective or feasible family.

## Exact finite check

Supports: Arithmetic for the specified finite law and the checked actions.

Does not establish:
A general theorem, empirical prevalence or calibration.

## File fingerprint

Supports: Exact inspected bytes or a pinned inventory.

Does not establish:
Scientific argument, algorithmic correctness or statistical calibration.

## Dated execution record

Supports: Output of the identified program, inputs and executed checks.

Does not establish:
Unexecuted capabilities or fitted-model correctness.

Keep editions, assumptions, pinned inputs and actual execution dates attached.
No lane establishes unperformed empirical work.
