What each evidence type supports

Discovery locates sources; inspected primary passages support substantive attribution.

Evidence	Supports	Does not establish
Inspected primary passage	Documents a stated target, method or claim in the inspected edition.	Suitability for this problem; a complete source-proof audit.
Local derivation	Stated conclusion under the declared assumptions and supplied argument.	Transfer to another law, objective or feasible family.
Exact finite check	Arithmetic for the specified finite law and the checked actions.	A general theorem, empirical prevalence or calibration.
File fingerprint	Exact inspected bytes or a pinned inventory.	Scientific argument, algorithmic correctness or statistical calibration.
Dated execution record	Output of the identified program, inputs and executed checks.	Unexecuted capabilities or fitted-model correctness.

Keep editions, assumptions, pinned inputs and actual execution dates attached.
No lane establishes unperformed empirical work.
