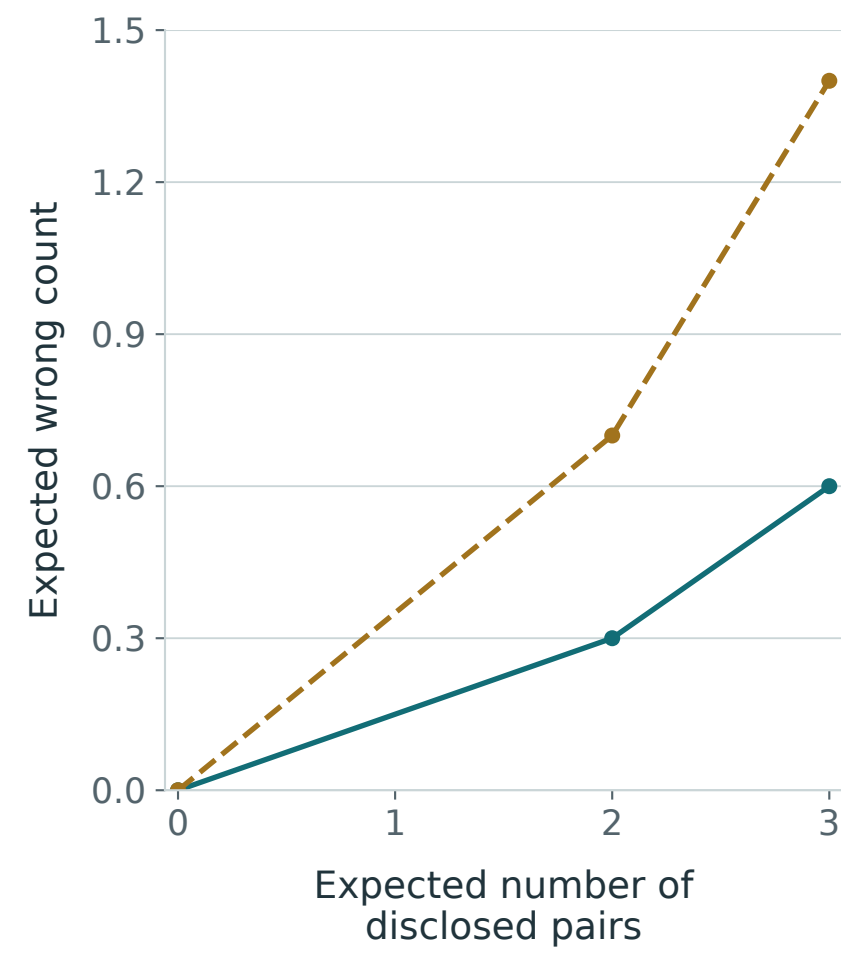
Three units, two objective contrasts

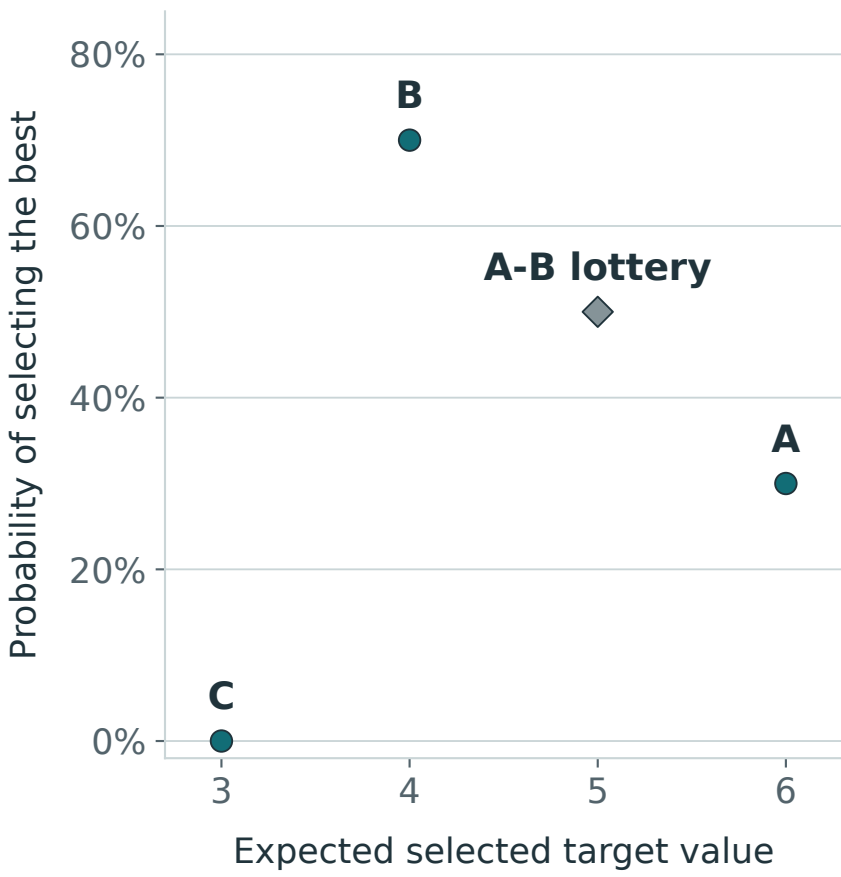
One exact synthetic law; larger targets have higher priority. No causal effect or empirical policy benefit is shown.

A. Reporting under one conditional law



Segments mix whole reports.
N = 1 is not a deterministic report.

B. A budget of one: different objectives



Circles select one named unit.
The diamond adds an independent, uniform A-B selection lottery to report 112.
A reported tie does not select a unit.

Reporting and allocation use different objectives. No fitted model, simulation or solver is shown.
