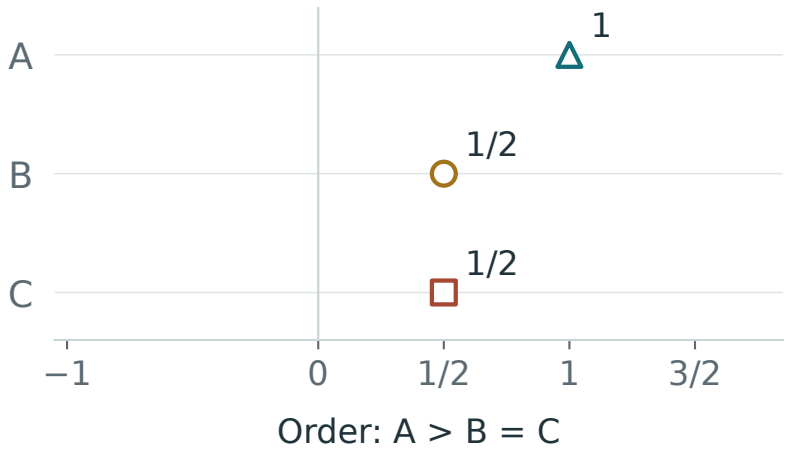
Units, transformations and target choice

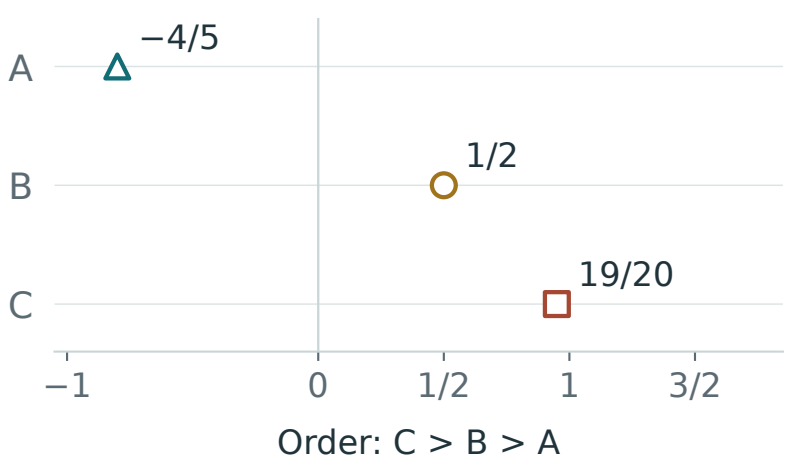
Exact targets: A = (−2, 4),
B = (1, 0), C = (2, −1)

(a) Original targets
Original composite
$a = (1/2, 1/2)$



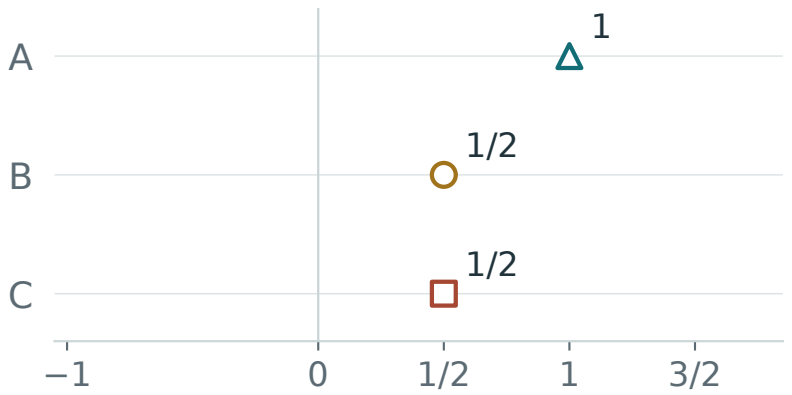
Order: A > B = C

(b) Positive rescaling
$\theta_2/10$, fixed coefficients
$a = (1/2, 1/2)$



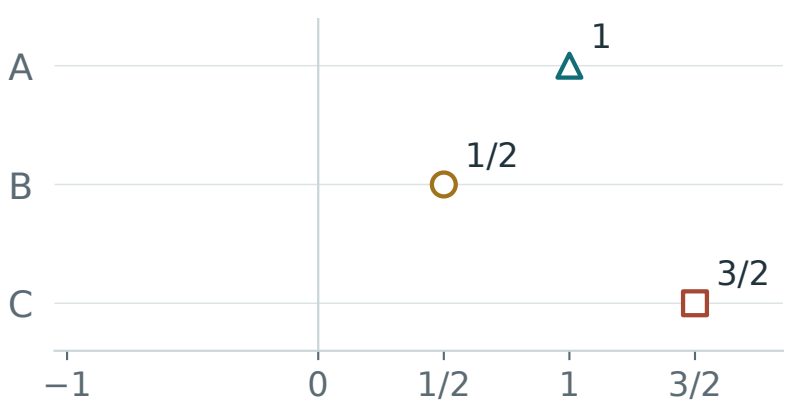
Order: C > B > A

(c) Same rescaling
Compensated $a = (1/2, 5)$
(no normalization)



Order: A > B = C

(d) Absolute value
of original criterion 2
Original $a = (1/2, 1/2)$



Order: C > A > B

All panels share the composite-value scale.
Positive rescaling preserves criterion directions.
Absolute value changes the signed target.
Cardinal a combines magnitudes;
w = (1/2, 1/2) weights directional mistakes.
