Choose the comparator by the institutional task

Task / method	Supplied input	Native output	Role of uncertainty / discrepancy
Ranking aggregation	Supplied rankings	Consensus ranking or bucket order	Disagreement between supplied relations
SMAA-2	Criteria and a modeled space of valuations	Rank-acceptability profiles	Variation across modeled criteria and valuations
Preference sorting	Performances and class judgments	Assignments to predefined classes	Unknown preference model; consultation in one variant
Multidomain posets	Known domain-specific partial orders	Simplified relation or ordered buckets	Uniform linear extensions of specified posets
Comparative judgement	Assessor choices between items	Pair support and rank summaries	Uncertain assessor preference propensities
Posterior grading	Beliefs about latent criterion targets	One coherent ordered grade report	Expected reporting loss under a declared law

Rows summarize distinct native tasks. Shared output labels do not imply the same target, objective, law or feasible family.
