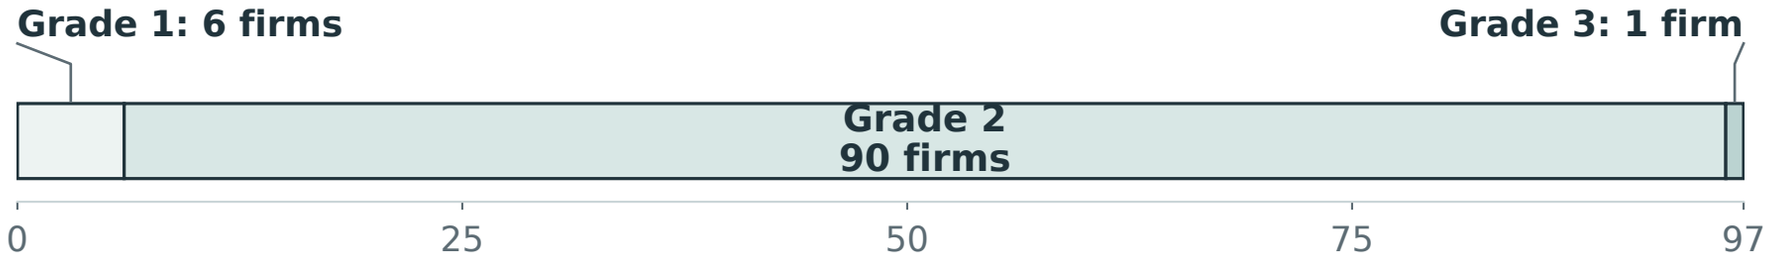
Two reconstructed common grade actions

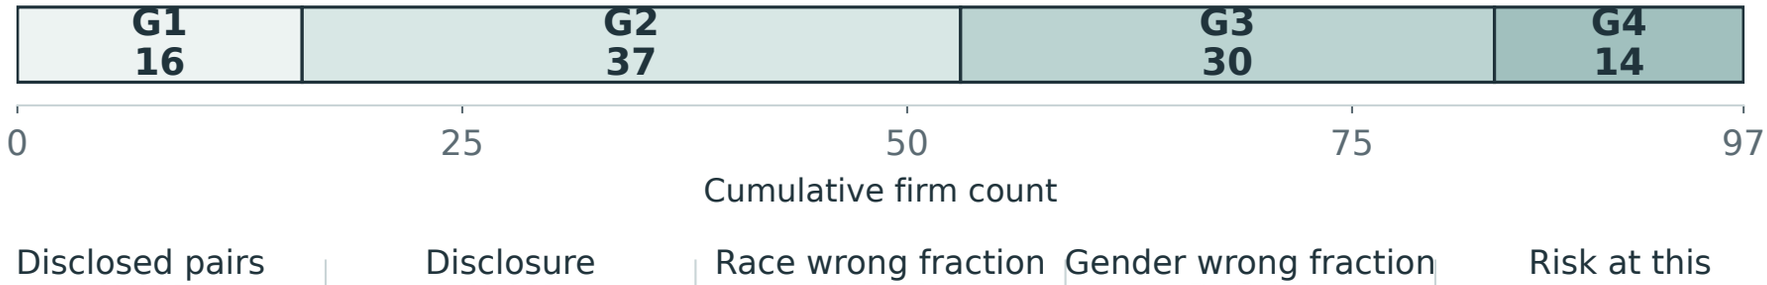
97 firms; equal race/gender directional weights; signed-target coefficients.
Highest priority at left; grade width is firm count.

τ = 1/4 (0.25); 3 of at most 4 grades



Disclosed pairs N / M	Disclosure N / M	Race wrong fraction D_R / N	Gender wrong fraction D_G / N	Risk at this row's τ
636 / 4,656	**0.137**	**0.196**	**0.237**	**0.2455**

τ = 9/20 (0.45); 4 of at most 4 grades



Disclosed pairs N / M	Disclosure N / M	Race wrong fraction D_R / N	Gender wrong fraction D_G / N	Risk at this row's τ
3,344 / 4,656	**0.718**	**0.312**	**0.336**	**0.3598**

Wrong fractions use disclosed pairs N; risk uses M = 4,656 and the row's own withholding cost.
Historical coefficient convention; common actions are an analyst extension of KRW's scalar cards.
Different costs do not establish a common-loss improvement, a frontier or an optimality certificate.
